I am a full-stack web developer with nearly a decade of experience in the tech industry developing web applications. My experience has spanned all areas of the tech stack, from database management to server & API iteration to front-end application development. I have managed projects, mentored developers and interfaced directly with clients. If there's a task to be done, I can do it.

The languages I can use include JavaScript/TypeScript (targeting both the browser and Node.js), C#, HTML, and Sass/CSS, and I've managed databases on SQL Server and PostgreSQL. I am highly proficient in contemporary build tooling such as npm, Gulp, Rollup and Webpack, including having written custom plugins for the latter three. I've worked with cloud storage, serverless functions and docker containers using Azure. I have a deep knowledge of web standards such as HTML5, the Document Object Model (DOM), Custom Elements, and Accessible Rich Internet Applications (ARIA), as well as web frameworks like Angular, React and Vue.js.

Programming fascinates and captivates me, and it always brings me pleasure when I use it to bring a vision to life. Through my contributions I hope to not only delight the end-user, but also help raise the level of my team. I believe my knowledge, experience and skills make me a good fit for any engineering role within an organization.
